PRODUCT REQUIREMENTS DOCUMENT • ANDROID-FIRST

SAKOON

Daily Care Companion

A gentle personal companion for everyday health habits, Islamic routine, study support, self-care and emotional balance.

HEALTH Flexible meals Gentle movement Water check-ins	FAITH Prayer checklist Quran / dua habits User-set routine
STUDY Task list Focus timer Break reminders	HEART Mood check-in Private journal Missing-Shohan support

PRODUCT PRINCIPLE
Support the user without body-shaming, food guilt, coercive reminders or emotional dependency. The girlfriend is the owner of her goals; relationship features are optional and respectful.

Prepared: 28 October 2026
Target: Android phones, Bangla-first experience
Delivery approach: Working PWA prototype + path to native Android package

This PDF specifies how to build and validate the app. The included prototype is a separate runnable web app; it is not yet a signed APK.

Contents

01. Executive summary and product principles
02. Goals, scope and non-goals
03. Users, user stories and navigation
04. Screen specifications
05. Health and nutrition safety
06. Islamic routine and study support
07. Emotional wellbeing and relationship design
08. Data, privacy and Android architecture
09. Functional requirements and acceptance criteria
10. QA, release plan and deployment steps
11. Copy-ready implementation prompt
12. References and limitations

QUICK START
For a hands-on demo, open the included sakoon_android_prototype/index.html in a browser. For an installable Android home-screen app, host the folder on HTTPS (for example, GitHub Pages), open it in Chrome on the phone, then choose Install app / Add to Home screen.

01. Executive summary and product principles

Sakoon is a private, gentle daily companion designed for a Bangla-speaking adult user who wants to care for her health, faith, study habits, self-expression and emotional wellbeing. It offers structure without turning daily life into a scorecard. The default product is a mobile-first Progressive Web App (PWA), which can be installed on an Android home screen and later wrapped as a native APK/AAB if distribution through an app store is needed.

Core experience

- Today: a small checklist, a progress indicator and one encouraging note.
- Health: flexible meal ideas, optional water logging and a gentle activity log; no strict calorie limit, body-size tracker or promise of belly-only fat loss.
- Faith: an optional checklist for the five daily prayers, Quran/meaning reading, dua or dhikr. Prayer times are supplied by the user from a trusted local source; no guessed timetable.
- Study: a simple task list and focus timer with adjustable 5, 15, 25 and 45 minute sessions.
- Heart: mood check-in, locally stored journaling, a breathing exercise and an editable affectionate message draft for when she misses Shohan.
- Self-care: gentle reminders about hygiene, comfortable grooming, sleep, confidence and kindness. Cuteness is framed as self-expression, not a requirement to change appearance.

Design principles

Principle	Product rule
Agency first	The person using the app chooses which reminders, tasks and goals matter. No partner dashboard or remote monitoring.
Body-respectful	No weight shaming, before/after imagery, body ranking, compulsory weighing or restrictive diet instructions.
Low pressure	Missing a habit is not a failure; users can skip, edit or reset checklists. No streak loss warnings.
Faith with humility	The app organizes user-chosen habits; it does not issue religious rulings or claim to calculate accurate prayer times in the prototype.
Privacy by default	Local-first storage, no account, no analytics and no automatic message sending.
Accessible and simple	Bangla-first labels, large tap targets, high contrast and short plain-language instructions.

SUCCESS LOOKS LIKE
The user feels more organized, supported and in control of her own day - not pressured to lose weight, prove affection, or complete every checkbox.

02. Goals, scope and non-goals

Product goals

- Help the user build sustainable daily habits for general wellbeing: meals, movement, rest and hydration awareness.
- Make it easy to follow a personally meaningful Islamic routine without inventing prayer times or judging missed activities.
- Reduce study friction through small tasks, a focus timer and break prompts.
- Offer a respectful outlet for emotions, including missing Shohan, while reinforcing that the user should still have her own interests and support network.
- Work on an Android phone with no paid AI API, no backend requirement and minimal setup cost.

MVP scope

Area	In the MVP	Out of scope for MVP
Daily dashboard	Daily habits, progress count, positive copy	Complex analytics, leaderboards
Health	Meal examples, water log, activity log	Medical diagnosis, calorie calculator, diet prescriptions, progress photos
Faith	Manual checklist for prayers and optional spiritual habits	Automatic prayer-time engine, fatwas, generated religious rulings
Study	Task list, focus timer, local completion state	Cloud classroom, AI tutor, exam-result prediction
Emotional wellbeing	Mood label, private journal, breathing exercise, message draft	Therapy bot, emergency monitoring, location tracking, message sending
Settings/privacy	Editable display names and local-only data	Accounts, partner login, cloud sync, advertising SDKs

Non-goals and hard boundaries

- Do not build an app whose purpose is to persuade or pressure the girlfriend to change her body for someone else.
- Do not set an aggressive weight-loss deadline or a universal calorie target. The user can use the app without setting a weight goal.
- Do not send the partner the user's notes, mood, checklists, prayer status, location or study activity.
- Do not automatically send romantic messages, manipulate attention, or generate guilt-based language.
- Do not promise that a routine will make someone objectively more attractive or that abdominal exercises will selectively remove belly fat.

AGE AND HEALTH SAFETY
The initial experience should focus on general habits. If a future release adds weight-management features, it must ask age category first. For users under 18, do not offer weight-loss targets or calorie restriction; direct them to a trusted adult and qualified health professional. Pregnancy, chronic illness, injury, medication concerns or a history of disordered eating should trigger cautious, professional-guidance wording.

03. Users, user stories and navigation

Primary user

A Bangla-speaking woman using an Android phone who wants a friendly structure for health, faith, study and personal wellbeing. She may miss her partner during the day, but the product should help her continue her own life rather than encourage constant checking or dependence.

User stories

- As a user, I want to see a short daily plan so I can begin without deciding everything from scratch.
- As a user, I want flexible meal suggestions made from familiar foods so I can eat regularly without being put on a strict diet.
- As a user, I want to log movement and water without being told that one number is mandatory for everyone.
- As a user, I want an optional prayer checklist and to add my own routine at my own pace.
- As a student, I want to break a difficult subject into small tasks and focus for a chosen amount of time.
- As a user missing Shohan, I want to journal or write a respectful message without the app sending it for me.
- As a user, I want private notes to stay on my phone and be erasable.

Navigation model

Tab	Purpose	Primary action
Today	Daily welcome, 5-item self-care checklist, progress, shortcuts	Check or uncheck a habit
Health	Meal ideas, water logger, movement tracker	Log water or an activity
Faith	Prayer checklist, Quran/dua habits, local-time note	Check a chosen habit
Study	Focus timer, add/complete/delete study tasks	Start a timer or task
Heart	Mood check-in, private note, message draft, breathing	Save a note or select a mood

First-run experience

- Open directly to Today; no account or permissions are required.
- Let the user edit the display name and partner name. Defaults are optional and editable.
- Show a short privacy note: data stays on this device in this version.
- Explain that the routine is optional, not medical advice, and not a measure of worth or religious sincerity.
- Avoid asking for weight, waist size, birth date, exact address, relationship status or location in the MVP.

Daily flow example

Morning: open Today, select a small intention and check the prayer routine if useful. Daytime: choose a meal idea, log movement, set one study task and use the focus timer. When missing Shohan: label the feeling, write a note, breathe for a minute or draft a message, then return to an activity she values. Evening: reflect gently and rest; incomplete tasks simply carry no penalty.

04. Screen specifications

Screen A - Today

Element	Requirement
Greeting	Warm Bangla greeting using editable display name; avoid commands about weight or appearance.
Progress	Show completed daily habits as X of 5 plus a simple progress bar. Never use shame copy for an incomplete day.
Daily checklist	Five editable default habits: take five minutes for self, gentle movement, nourishing meal, study focus session, kind self-talk.
Shortcuts	Buttons to Health, Faith, Study and Heart tabs.
Self-care message	One short reminder that confidence, kindness, hygiene and self-expression are not dependent on body size.
Profile settings	Editable display name and partner name; store locally.

Screen B - Health

- Show four flexible meal ideas: breakfast, lunch, snack and dinner, with culturally familiar food examples such as rice/roti, dal, vegetables, eggs, fish, fruit, chickpeas, nuts or yogurt where suitable.
- Explain that portions and food choices depend on appetite, culture, allergies, budget, age and health; the user should not skip meals to punish herself.
- Water logger counts user-entered glasses but does not set a universal target or send alarmist warnings. Explain that needs vary and excess water is not the goal.
- Movement logger supports walking, stretching, dancing, cycling, chores and recovery/rest. The user selects a duration; the app records it as a personal note, not a medical score.
- Include a balanced disclaimer that body fat distribution differs and abdominal exercises should not be promised to remove fat from only the belly.

Screen C - Faith

- Optional checklist for Fajr, Dhuhr, Asr, Maghrib and Isha, plus Quran/meaning reading, dua/dhikr and kindness.
- Do not label prayer as completed or missed unless the user taps the checkbox.
- The MVP does not calculate or announce prayer times. Tell users to confirm times with their local mosque or a trusted prayer timetable.
- Use respectful wording: the checklist is a support tool, not a religious authority. Do not invent Arabic text or religious rulings.

Screen D - Study

- Allow adding a subject/task up to 100 characters, checking completion and deleting a task.
- Focus timer options: 5, 15, 25 and 45 minutes. Start, pause and reset must work; timer completion shows a gentle break prompt.
- Do not make alarms or completion claims if the app is closed; background notifications are a later feature.

Screen E - Heart

- Mood choices: good, okay, low, anxious and tired. Mood history stays local; do not diagnose.
- Journal textarea auto-saves locally. Show clear notice that entries are not sent to Shohan or any server.
- Generate an optional editable affectionate message draft. The user must copy/send it manually; no automatic sending.
- Offer a 60-second gentle breathing guide with a clear stop button and instruction to stop if uncomfortable.

- Provide a soft signpost to trusted people and professional support if distress lasts or disrupts everyday life.

05. Health and nutrition safety

Content model

The app is a habit-support tool, not a weight-loss prescription. Its user-facing goal is better everyday wellbeing, not an exact body shape. If the user voluntarily wants to change weight, the app should encourage sustainable lifestyle patterns and qualified advice where appropriate rather than promising rapid results.

Allowed content

- Regular, balanced meals; a mix of food groups where available and appropriate.
- Enjoyable movement that begins at a realistic level and can be increased gradually if comfortable.
- Rest, sleep routines, stress management and hydration awareness.
- Optional reflection on energy, mood or consistency rather than compulsory weighing.
- A reminder that activity may be adapted for disability, injury, pregnancy, chronic illness or other individual needs.

Disallowed content

- Starvation, meal-skipping challenges, purging, laxatives, detox teas, unprescribed weight-loss medicine or extreme fasting recommendations.
- A promised date to lose belly fat, a fixed daily calorie target without a qualified assessment, or guaranteed results.
- Body-shaming phrases, comments such as "too fat", comparisons with other women, or partner-controlled compliance.
- Unverified claims about supplements, hormones, metabolism hacks or local remedies.

Safe default movement

Starting state	App behavior
Not active recently	Offer 5-10 minutes of comfortable movement as an optional starting point. Allow rest.
Already active	Let user choose an activity and duration; no automatic escalation.
Pain, dizziness, unusual breathlessness or feeling unwell	Prompt user to stop and seek appropriate medical advice if symptoms are significant or persistent.
Known medical condition, pregnancy/postpartum, injury or mobility limitation	State that activity/food plans may need individual professional guidance.
User may be under 18	No weight-loss goals, calorie restriction or body measurements. Keep focus on routine, nourishment, play/movement and wellbeing.

Reference guideline for adult activity

The World Health Organization states that adults aged 18-64 should generally aim for 150-300 minutes of moderate-intensity aerobic activity per week, or an equivalent combination, and muscle-strengthening activity on 2 or more days per week. This is contextual guidance for the product specification, not a requirement imposed on the user. Start from capability and build gradually. Source: WHO physical activity guidance.

Weight and belly-fat language

Never say that abdominal exercise alone guarantees belly-fat loss. A credible health explainer from the British Heart Foundation notes that exercise cannot target fat loss only at the middle; activity can strengthen muscles while overall body-fat changes differ between people. Source: British Heart Foundation: belly fat and exercise.

SAFETY COPY TO REUSE
"This app shares general wellbeing ideas, not medical advice. You do not need to lose weight to deserve care. Avoid extreme diets or unprescribed products. If you have a health condition, are pregnant, are under 18, or feel unwell, speak with a qualified health professional or a trusted adult as appropriate."

06. Islamic routine and study support

Faith feature rules

- Faith features are opt-in and can be skipped or edited. They should not be used to assess how religious the person is.
- The five prayer names are presented in a checklist, not as automatic religious verification.
- The user can use a mosque, trusted Islamic calendar or existing prayer app to confirm local times. Future automatic calculation must document its calculation method, location permissions, juristic settings and daylight-saving/time-zone handling where relevant.
- If adding Quran verses, translations, transliteration or dua content in a future release, use trusted sources, cite the source inside the app and get qualified review. The MVP should not generate scripture or rulings with AI.
- Never present a skipped checkbox as a spiritual failure. Use gentle, non-judgmental reminders only after the user chooses reminder settings.

Study helper behavior

Requirement	Acceptance behavior
Create task	User can add a non-empty task; white spaces only are rejected.
Task completion	Tap checkbox; status updates immediately and persists after refresh.
Task removal	A delete control removes the selected task only.
Focus timer	Start counts down once per second; pause freezes remaining time; reset restores 25:00.
Preset selection	5/15/25/45 minute selection resets the timer to the chosen duration.
Timer done	Shows a friendly completion message and optional vibration if supported/allowed. No sound dependency.
Offline behavior	Timer and tasks continue to work while the app page remains open offline. No claim that the timer keeps running if the browser kills the page.

Suggested study routine examples

- One short session: open one chapter, identify one topic, focus for 15 minutes, then rest.
- Exam preparation: add three small tasks instead of a single huge item (e.g. review notes, solve five questions, revise mistakes).
- Low-energy day: use a 5-minute timer to start. Ending early is allowed; rest is not failure.

Reminder design

The MVP uses visible in-app prompts only. Actual background Android notifications are not included. A future native/PWA notifications feature must ask permission clearly, allow notification categories and quiet hours, and never use guilt to force attention.

07. Emotional wellbeing and relationship design

Missing Shohan - intended purpose

The relationship area acknowledges longing as a normal emotion, then helps the user express it respectfully and return to her own needs. The app is not a substitute for reciprocal communication, friendships, family, study, faith or professional support.

Required behaviors

- A mood check-in can be selected without entering a reason.
- A journal autosaves on the same device. It must never be exposed in a partner dashboard or transmitted by default.
- An optional draft may say: "Shohan, I miss you a little extra today. ❤ Hope you are doing well. I am trying to make my own day meaningful too - message me when you are free."
- The user can edit, copy, discard or ignore the message. It should never be automatically sent.
- A breathing activity must include a stop control and avoid promising that it cures anxiety.
- If the user indicates prolonged distress or safety concerns, advise contacting a trusted person or an appropriate professional/service. Do not diagnose or pretend to monitor risk.

Prohibited relationship patterns

- No location sharing, online-status monitoring, call/text surveillance, secret tracking or hidden partner alerts.
- No jealousy hooks, streaks for messaging, punishments for not replying, or statements that the user needs Shohan to feel okay.
- No automatic messages, forced romantic notifications or partner-only access to private information.
- No guilt copy such as "If you loved him, you would...". Keep affectionate copy optional and user-controlled.

Self-care / feeling cute

The product can offer optional ideas such as brushing teeth, comfortable skincare, tidying hair, wearing clothes the user likes, getting enough sleep, practicing a skill, smiling naturally or speaking kindly. It must frame these as comfort and self-expression, not obligations to become more attractive or to satisfy a partner.

Suggested copy patterns

Use	Avoid
"You can take one small step today."	"You failed today."
"It is okay to miss someone and still care for yourself."	"You should spend all day thinking about him."
"Choose what feels comfortable for your body."	"Fix your body to be cute."
"Your note stays on this device in this version."	"Your partner can see your progress."
"Take a break if this feels uncomfortable."	"Push through pain to burn belly fat."

08. Data, privacy and Android architecture

Recommended MVP architecture

Layer	Implementation
UI	Single-page HTML/CSS/JavaScript, mobile-first, Bangla labels, accessible semantic controls.
Packaging	PWA manifest + service worker for HTTPS installation and cached shell.
Persistence	localStorage JSON object, separated by date for daily checklists and notes.
Backend	None. No account, database, AI API, analytics, ad SDK or external requests.
Hosting	Static HTTPS hosting such as GitHub Pages. A native wrapper can be considered after testing.
Native path	If store distribution is needed, wrap the same UI with a reviewed WebView/Capacitor project, configure app ID, icons, signing and privacy disclosures.

Data model

Key / object	Fields	Notes
profile	displayName, partnerName	User-editable; no real name required.
dailyTasks[date]	habitId -> boolean	Only local date key; reset daily view based on date.
water[date]	integer count	Log count only, not a compulsory target.
movement[date]	activity, minutes, done	Personal log, not medical data.
faith[date]	prayer/habit ID -> boolean	Optional checklist.
study[]	id, title, done, createdAt	User can delete tasks.
moods[date]	mood label	No diagnosis.
notes[date]	free text	Sensitive private text; stored locally.
timerValue	seconds remaining	Volatile; reset/restore behavior should be documented.

Privacy requirements

- Display a just-in-time note before the first journal entry: notes are local to this browser/device and may be lost if site data is cleared.
- Avoid third-party analytics, ads, remote fonts, external tracking pixels and location permissions in MVP.
- Provide a "clear my data" control in a release-ready settings page; confirm before clearing all stored entries.
- Do not collect or infer body weight, waist measurements, precise location, religious belief history or partner activity.
- If cloud sync or accounts are added later, require explicit opt-in, encryption in transit, a deletion flow, a clear retention policy and separate disclosure.

Android installation options

Option	Pros	Trade-offs
PWA install	Lowest cost; HTTPS site can be added to Android home screen; one codebase.	Requires hosting; native OS/background behavior is limited; notifications are not part of MVP.
Native wrapper	Can produce an APK/AAB with app icon, package ID and improved OS integration.	Needs Android Studio/SDK, signing, testing and maintenance; a wrapper does not make unsafe content acceptable.

PROTOTYPE STATUS
The included project is a functional PWA-style prototype. It is not yet a signed APK/AAB and does not include background notifications, automatic prayer-time calculation or cloud sync. See README.md for local testing and free-hosting steps.

09. Functional requirements and acceptance criteria

MVP functional requirements

ID	Requirement	Pass condition
FR-01	Five daily habits	Each checkbox toggles; completion count and percentage update immediately and survive refresh.
FR-02	Date-based state	New local day starts with a fresh daily checklist and water counter; prior local entries do not appear as today.
FR-03	Flexible meal guidance	Meal ideas appear with a clear disclaimer; no calorie targets or guaranteed results.
FR-04	Water logger	Add, subtract and reset actions work; count cannot go below zero.
FR-05	Movement tracker	User can select an activity and minutes, mark it done and reset it.
FR-06	Faith checklist	Prayer and optional habits can be checked independently and persist after refresh.
FR-07	Study task list	Add, complete, delete and remove completed items; reject empty input.
FR-08	Focus timer	Start, pause, preset and reset behave correctly; no duplicate intervals.
FR-09	Mood & journal	Mood selection persists; typed journal text autosaves; no network request sends it.
FR-10	Message draft	Draft appears only after user action; copy or discard manually; no automatic send.
FR-11	Breathing guide	Start, stop and completion states work; user can stop at any time.
FR-12	Profile names	User can edit display and partner names; changes show in relevant screens.
FR-13	Offline shell	After first HTTPS visit/cache installation, core pages load without a network connection.
FR-14	Responsive layout	Works at 320 px width and on common Android screen sizes without horizontal overflow.
FR-15	Privacy	No external network calls except the static host; local data remains in browser storage.

Accessibility and usability acceptance

- All buttons have clear labels; important actions are not represented by color alone.
- Checkboxes and form fields are reachable using keyboard navigation and have labels.
- Text remains readable at default browser font size; tap targets should generally be at least 44 x 44 CSS pixels where practical.
- Keep the bottom navigation visible, but ensure content can scroll above it and is not obscured by safe-area insets.
- Do not flash, shame, or use alarmist warnings to call attention to missed goals.

Security and content checks

- Escape all user-supplied text before inserting into HTML to prevent script injection.
- Confirm that names and journal entries do not appear in URLs, console logs or network requests.
- Check health messages for extreme diet language and relationship copy for coercion.
- Review religious wording before adding any quoted scripture or translation.

10. QA, release plan and deployment steps

Manual test checklist

Test	Steps	Expected result
Daily habit state	Check two habits, refresh, then open other tabs.	Count and progress persist; only chosen habits are checked.
Next day	Simulate a date change or test helper with another date key.	New day checklist and water count begin empty.
Water edge	Remove when count is zero, then add and reset.	Count never negative; reset returns to zero.
Movement	Select activity + 15 minutes, log, refresh.	Choice and done state persist for current day.
Faith	Toggle each prayer and an optional habit.	Each state is independent and persists.
Study CRUD	Add blank and valid tasks, complete one, delete one.	Blank rejected; valid task can be created, completed and deleted.
Timer	Start, pause, resume, choose preset and reset.	One countdown runs; remaining time is correct; reset returns 25:00.
Journal	Type text, navigate to another tab and return.	Text stays saved locally. No auto-send.
Profile	Change two names and save.	Greeting and message draft use updated values.
Offline	Visit once over HTTPS, disconnect network, reopen.	Cached shell loads; dynamic offline features work.
Responsive	Check narrow phone viewport and portrait rotation.	No horizontal overflow; bottom nav does not cover buttons.
Privacy	Inspect browser Network tab.	No requests to analytics or AI services.

Build and release sequence

- Stage 1 - Prototype: use the supplied HTML files; validate interactions and Bangla rendering on a real Android phone.
- Stage 2 - User feedback: let the intended user choose what she actually wants; remove features she finds intrusive or irrelevant.
- Stage 3 - PWA pilot: host on HTTPS, install from Chrome and confirm offline shell caching.
- Stage 4 - Privacy and content review: check local data deletion, medical disclaimers, religious wording and relationship-safety copy.
- Stage 5 - Native package if needed: wrap after requirements are stable, configure package ID and icons, build signed APK/AAB, test on multiple devices and prepare store disclosures.

Free hosting instructions: GitHub Pages

1. Create a GitHub repository and upload every file from the supplied sakoon_android_prototype folder. 2. In repository Settings, open Pages. 3. Choose deployment from the main branch and root folder, then save. 4. Open the generated HTTPS URL in Chrome on Android. 5. Choose Chrome menu > Install app or Add to Home screen. 6. Open the installed app once while online so the service worker can cache the shell. The exact menu wording may vary by Chrome version.

Release checklist

- Confirm the user understands local-only storage and can clear it.
- Confirm the user, not the partner, controls settings and checklists.
- Confirm no APK is claimed unless a signed APK file was actually built and tested.
- Keep an in-app support/about page with safety, privacy and app-version information.

11. Copy-ready implementation prompt

Paste the prompt below into a coding assistant or app-builder together with the prototype folder and this PDF. It defines the expected output without assuming access to a paid AI service.

You are a senior Android/PWA engineer and product designer. Build and refine Sakoon - Daily Care Companion using plain HTML, CSS and JavaScript, with no paid APIs and no backend required for the MVP. The UI must be Bangla-first, responsive on Android phones, accessible, warm and calm. Use the provided product requirements as the source of truth. Do not remove any required feature without explaining why. Keep user data local by default.

Required modules: (1) Today dashboard with five daily wellbeing habits and progress; (2) Health with flexible familiar meal examples, non-prescriptive water logging and a gentle movement tracker; (3) Faith with optional prayer/Quran/dua checklists but no guessed prayer timetable; (4) Study with task management and a working 5/15/25/45-minute focus timer; (5) Heart with mood check-in, private journal, an optional message draft for missing Shohan and a stoppable breathing exercise; (6) editable local display and partner names; (7) local persistence, PWA manifest and service worker.

Safety rules: No body shaming, calorie limits, starvation, unsafe weight-loss products, guaranteed belly-only fat loss, weight-loss targets for minors, religious rulings, fake prayer times, partner surveillance, automatic romantic messages, hidden tracking or data sharing. Explain that the product is general wellbeing support, not medical advice. The user must control every checklist, reminder and message.

Technical requirements: No analytics, ads, external AI APIs or remote database. Escape user-generated text before HTML insertion. Ensure data survives refresh and that daily state is date-keyed. Make timer pause/resume/reset correct and avoid duplicate intervals. Add a visible clear-data action before calling the product release-ready. The PWA shell must cache and load offline after the first successful HTTPS visit. Include README instructions for local testing and GitHub Pages hosting.

Deliverables: (a) complete source code, (b) runnable local demo, (c) installation instructions for Android, (d) test report covering all functional acceptance criteria in Section 9, (e) list of limitations. Do not say an APK was built unless a real signed APK/AAB exists and has been tested on Android.

IMPLEMENTATION ORDER

First preserve and test existing behavior. Then add missing data-clear controls, improve accessibility, test local persistence, check offline caching, and only then consider native packaging.

12. References and limitations

Health sources used for this specification

World Health Organization - Physical activity. Adult activity guidance and the principle that some activity is better than none. https://www.who.int/initiatives/behealthy/physical-activity

U.S. Centers for Disease Control and Prevention - Steps for Losing Weight. Healthy weight management emphasizes sustainable eating patterns, activity, sleep and stress management; individual factors can affect weight. This app deliberately avoids copying a weight-loss prescription. https://www.cdc.gov/healthy-weight-growth/losing-weight/

British Heart Foundation - What is the best exercise to lose belly fat? Explains why exercise should not be marketed as a way to selectively lose fat only from the middle. https://www.bhf.org.uk/informationsupport/heart-matters-magazine/activity/best-exercise-to-lose-belly-fat

What this specification does not claim

- It is not a medical assessment of the intended user and does not determine whether weight loss is needed.
- It is not a religious authority and does not provide verified local prayer times or rulings.
- The HTML prototype is not a signed native Android APK and has no background notifications, server sync or account system.
- The breathing exercise is a simple optional grounding activity, not treatment for a mental health condition.

Known prototype limitations to close before a public release

- Add a visible clear-all-data control with confirmation and a privacy/about screen.
- Add an explicit preference page for user-controlled reminder times before adding real notifications.
- Test with real Android screen readers and device sizes; refine focus states and accessible labels.
- Review local storage durability and date boundaries across time-zone changes.
- Conduct qualified review before expanding nutrition, medical or religious content.

FINAL PRODUCT PROMISE
Sakoon should make daily care easier and kinder. It should never make the user feel that her body, faith, study progress or relationship emotions are a test she must pass.

End of Product Requirements Document
